

Sig-Tec Software Selected by BryanLGH Health System to Add Fingerprint Biometrics, Single Sign On and Sonar Technology for Cardiology Department

Minneapolis, Minn. November 14th-- Sig-Tec Corporation, a leader in identity and access management software solutions announced today the selection of their SPD for Strong Authentication and AppStarter Single Sign On by BryanLGH. Chief Information Officer for Bryan LGH Rich Marreel states "by adding Sig-Tec we have addressed a critical initiative in our cardiology department to strengthen security, patient privacy, and improve physician workflow

Sig-Tec's SPD and AppStarter products were deployed as the software components to provide the strong authentication and password management. BryanLGH's infrastructure was maintained and no modifications or external server components are added. A fingerprint biometric reader and sonar device were selected as the technology components to provide the strong authentication access and automatic fast logoff when the doctor walks away.

With Sig-Tec's solution in place the end-user simply puts their finger on the biometric fingerprint reader for access into the network and the enabled CPACS applications. At any enabled workstation throughout the environment authentication is quick and secure. When the clinician is done with the workstation, they walk away and the RFIDEas sonar device automatically logs the user off the desktop. John McGuire, National Sales Manager for Sig-Tec, says "we are excited to be delivering a solution to the healthcare community that is easy to install, configure, use, and maintain. Addressing the growing IT security demands and clinician workflow need for healthcares is our specialty. Robert Hoghaug, our CTO, has put an enormous level of importance on listening to the healthcare community, both clinical and IT, in designing a solution that improves patient care and address short and long term business strategies for security and workflow."

Brian Sivill, Cardiac PACS Coordinator for BryanLGH states that "after many years in the industry, it is extremely gratifying to see a company like Sig-Tec be able to deliver the solution we desired within a short timeline." The configuration and deployment of the software took less than 12 hours. Project Manager for Sig-Tec Paul Kobs says, "BryanLGH had several unique factors in their environment relating to their CPACS Software. We addressed these requirements and were able to deliver a solution within the timeline, budget and scope. We are looking forward to their next deployment and continuing to deliver our seamless IT solution."

BryanLGH is planning to expand and deploy additional departments in first quarter of 2009.

About Sig-Tec

Sig-Tec is a software engineering company that has created a winning suite of Identity and Access Management solutions that raises the standard for performance in today's IdAM market. Sig-Tec's philosophy in building software solutions acknowledges every customers expectations for a fundamental and reliable solution that is flexible, easy to implement, use and manage. The foundational products of this suite are "AppStarter" Single Sign On and "SPD" for Strong Authentication. These software solutions make addressing strong passwords and password management fast, simple, and inexpensive for any organization by easily installing in the existing infrastructure in days, not months. Sig-Tec's identity and access management software has been carefully developed with extensive research with Chief Medical Officers, Chief Information Officers, Chief Security Officers, Directors of IT security, network administrators, security analysts and many industry experts.
